Do the following: 1) If a job operation is already running, retry the operation after the existing job is completed. 2) If job count has reached maximum count supported (256 jobs for iDRAC9), reduce the job count by deleting one or more jobs. To delete all completed jobs using RACADM command line utility, type "racadm jobqueue delete --all" or using iDRAC GUI via Maintenance->Job Queue. Once jobs are deleted retry the operation. 3) If the issue persists, reset the iDRAC and then retry the operation. To reset the iDRAC using RACADM command line utility, type "racadm racreset" or using iDRAC GUI via Maintenance->Diagnostics->Reset iDRAC.

Detailed Description

Recommended Response

Action Make sure of the following and retry the operation: 1) A physical drive or virtual drive with the FQDD entered exists. 2) The physical drive (s) supports the operation being tried. For more information about supported physical drives, see the iDRAC Users Guide available on the support site.

STOR0701

Message: Storage objects are unavailable in the current system configuration.

Detailed Description There are no RAID controllers, physical disks or virtual disks discovered by instrumentation that can be configured.

Recommended Response Action Storage objects are unavailable in the current system configuration. Make sure that the storage devices are installed in the system, and then retry the operation after the Collect System Inventory On Restart (CSIOR) feature has updated the system inventory.

Message Unable to create the job because another job is currently running

The requested job cannot be run because another job is currently running. Two options for running jobs on multiple storage controllers are: 1) Run the jobs on each controller individually. Wait for each job to complete before starting the configuration and job creation on the next controller. 2) Schedule multiple jobs to run at a later time using the scheduling options.

Detailed Description

Recommended Response Action Make sure that the currently running job is completed, and then retry the operation. If necessary, recreate the configuration and the job. For information about running jobs on multiple storage controllers, see the iDRAC Online Help or iDRAC Users Guide.

STOR14

Message The peripheral sled in slot arg1 initialization is not complete.

Arguments arg1 = slot number

Detailed Description Peripheral sled initialization is not successful with following possible reasons: 1) FRU is not functioning. 2) Sled internal components are not responding. 3) Component power state is not good. 4) Hardware configuration errors.

Recommended Response Action Do the following: 1) Check system log for further information about the issue, 2) Remove and re-insert the peripheral sled identified in the message or virtual reseal the sled, 3) Reset the CMC and wait for a few minutes for the CMC to finish restarting. If the issue persists, contact your service provider.

STOR15

Message	The storage sled arg1 is improperly configured.
Arguments	arg1 = slot number
Detailed Description	The storage sled identified in the message was inserted in a location which does not support split dual host operation mode. The storage sled can functionally work in the current location with only primary PERC controller enabled.
Recommended Response Action	Do one of the following: 1) Change the operating mode of the storage sled identified in the message. 2) Insert the storage sled to a different slot.

STOR17

Message	The fault-tolerant pair of RAID controllers arg1 and arg2 can have issues in their PCIe fabric because both controllers are on the same PCIe fabric.
Arguments	arg1 = RAID controller 1 arg2 = RAID controller 2
Detailed Description	The two RAID controllers are on the same PCIe Fabric. This means that an issue with a single PCIe switch or Mezzanine card could result in the loss of all storage functionality from this pair of controllers.
Recommended Response Action	Change the slot location of one of the RAID Controllers.

STOR311

Message A firmware update was applied to a drive that requires a DC power cycle (cold boot). If the drive is in an external enclosure, the updated firmware will only be activated after a DC power cycle of the enclosure.

Detailed Description A drive firmware update was applied but requires a DC power cycle (cold boot) to activate. If the drive is internal to the system performing the update, no further action is required. If the drive is in an external enclosure, the enclosure must be turned off and then turned on in order for the updated drive firmware to activate.

Recommended Response Action If the drive is internal to the system performing the update, no further action is required. If the drive is in an external enclosure, the enclosure must be turned off and then turned on in order for the updated drive firmware to activate. After turning off the external enclosure, wait for drives to spin down before turning the enclosure back on. The drive firmware will activate after the enclosure is turned back on.

Message Unable to perform the reconfiguration operation because the number of physical disks specified in the disk group is not as per the permitted range.

Detailed Description A disk drive group has a limit on the minimum and maximum number of disk drives it can have on the basis of its Virtual Disk RAID level. When a reconfiguration operation is specified with additional physical disks the total number of physical disks should be in the disk groups permissible range.

Recommended Response Action Enter the correct number of physical disks for the reconfiguration operation and retry the operation. The number of physical disks in a disk group must be within the disk groups permissible range. For information about the minimum and maximum possible physical disks in a disk group, see the Lifecycle Controller Users Guide available at the support site.

STOR318

Message Unable to perform the reconfiguration operation because the Virtual Disk size specified is invalid.

Detailed Description Expansion of storage capacity of a Virtual Disk is limited by the disk space of its physical disks and the Virtual Disk RAID level. Based on these two values there is a maximum limit on the capacity expansion size of a Virtual Disk.

Recommended Response Action Make sure that the Virtual Disk size specified for the reconfiguration operation is less than or equal to the maximum possible value. For information about the maximum possible value, see the Lifecycle Controller Users Guide available at the support site.

STOR320

Message Unable to start the reconfiguration operation because the requested reconfiguration operation is invalid.

Detailed Description The storage controller does not support online capacity expansion and RAID level migration of a Virtual Disk at the same time.

Recommended Response Action There are two Reconfiguration operations possible on a Virtual Disk 1) Online Expansion of the storage capacity 2) RAID level migration . Only one of the above two operations can be specified in a Reconfiguration operation. Make sure that only one of the above two operation types is requested and retry the operation. Also make sure that if provided, the Virtual Disk size is at least 1% of the maximum expansion size possible. Also make sure that if provided, the new Virtual Disk RAID level is different from the existing raid level.

STOR394

Message	Unable to discover the physical drive installed on the enclosure arg1 , slot arg2 , arg3 , because of incompatibility issues.
Arguments	arg1 = enclID arg2 = slotNum arg3 = controller FQDD
Detailed Description	The physical drive identified in message cannot be discovered because of incompatibility issues. Some of the issues because of which a device cannot be discovered are as follows: Missing namespace in NSID 1. No namespace is created. Logical Block Addressing (LBA) size is not either one of these: 512 B or 4K. When the Protection Information (PI) feature is enabled.
Recommended Response Action	1) Resolve the issue by using the instructions provided on the interface (for example, HII or PERC CLI). 2) Else, if a resolution is not suggested by the interface because the interface does not support, do the following: 2a) Restart the server. 2b) When the company logo is displayed, press F2. 2b) Click Device Setting > Select the RAID Controller > Main Menu > Hardware Components > Enclosure Management. 3) If the issue persists, remove the NVMe drive identified in the message, and replace it with a working drive. If the issue is not resolved, contact your service provider. For more information about repairing issues in NVMe drives, see the relevant PERC Users Guide available on the support site.

STOR5

Message Redundancy lost. arg1

Arguments arg1 = VD/Enclosure Name

Detailed Description A virtual disk or enclosure has lost data redundancy. In the case of a virtual disk, one or more physical disks included in the virtual disk have failed. Due to the failed physical disk or disks, the virtual disk is no longer maintaining redundant (mirrored or parity) data. The failure of an additional physical disk will result in lost data. In the case of an enclosure, more than one enclosure component has failed. For example, the enclosure may have suffered the loss of all fans or all power supplies.

Identify and replace the failed components. To identify the failed component, select the Storage object and click the Health subtab. The controller status displayed on the Health subtab indicates whether a controller has a failed or degraded component. Click the controller that displays a Warning or Failed status. This action displays the controller Health subtab which displays the status of the individual controller components. Continue clicking the components with a Warning or Failed status until you identify the failed component. See Storage Health for more information. See the enclosure documentation for information on replacing enclosure components and for other diagnostic information.

SUP009

Message Driver pack update in progress - Delete failed.

Detailed Description Because of the size of the driver pack, the update process removes the older version of the driver pack from the system before installing the newer version. For that reason, the driver pack update cannot be deleted.

Recommended Response Action Wait for the Driver Pack update to complete. To revert to the previous version of the update, download and update the firmware to the version desired.

SUP032

Message Unable to roll back the firmware version because one or more features that do not support the Rollback feature are currently enabled.

Detailed Description The firmware version cannot be rolled back because one or more features that do not support the Rollback feature are currently enabled.

Recommended Response Action Make sure that the features that do not support the Rollback feature are disabled, and then retry the operation. For example, if PERC SEKM is enabled then rolling back to a firmware version that does not support SEKM is not allowed. Therefore, disable SEKM on iDRAC or remove the SEKM-enabled PERC controller, and then try the rollback operation.

Message Unable to update the arg1 firmware to version arg2 because the operation is not supported or the device is in a locked state or the device is not present in the target system.

Arguments arg1 = component arg2 = version

Detailed Description The firmware image specified in the operation did not apply successfully. An internal error may have occurred because the operation may not be supported, or the device is not present in the target system or disabled for performing the update. For BOSS controller, the device may be in a locked state.

Recommended Response Action 1) Identify and download the latest firmware version that corresponds to the component being updated in the target system inventory, and retry the operation. For a list of supported firmware versions, refer to the iDRAC Users Guide available on the support site. 2) Enable the CSIOR if disabled, reboot the host, complete the CSIOR operation and retry the operation. Refer the iDRAC/ LC Users Guide available on the support site for procedure to enable the CSIOR. 3) Enable the component if disabled, and retry the operation. 4) Add the component if not present in the target system, complete the CSIOR operation and retry the operation.

Message	Unable to update the firmware of the component arg1 to version arg2 because the update operation was abruptly stopped. The reason for abrupt stoppage: arg3 .
Arguments	arg1 = componentName arg2 = versionNum arg3 = reason

Detailed Description

The firmware image specified in the operation did not apply successfully. An internal error may have occurred because the operation may not be supported, or the device is not present in the target system or disabled for performing the update. For BOSS controller, the device may be in a locked state.

Recommended Response Action

1) Identify and download the latest firmware version that corresponds to the component being updated in the target system inventory, and retry the operation. For a list of supported firmware versions, refer to the iDRAC Users Guide available on the support site.2) Enable the CSIOR if disabled, reboot the host, complete the CSIOR operation and retry the operation. Refer the iDRAC/ LC Users Guide available on the support site for procedure to enable the CSIOR.3) Enable the component if disabled, and retry the operation.4) Add the component if not present in the target system, complete the CSIOR operation and retry the operation.

Message

Unable to complete the update operation because the Update Package is not supported by the Lifecycle Controller user interface.

Detailed Description

The update operation cannot be completed because the Update Package used is not supported by the Lifecycle Controller user interface.

Recommended Response Action

Do one of the following and retry the operation: 1) Make sure that the Update Package is supported by the Lifecycle Controller user interface. 2) Use other interfaces such as iDRAC Graphical User Interface (GUI). For information about the supported Update Packages, see the Lifecycle Controller Users Guide available on the support site.

StorageFabric Validation Alert Event Messages

SVAL0001

Message Unable to add alert subscriber arg1 to database because the ID already exists.

Arguments arg1 = alert ID

Detailed Description The alert subscriber identified in the message cannot be added to database because the ID already exists.

Recommended Response Action Enter a valid and unique subscriber ID and retry the operation.

Category Configuration (SVAL = StorageFabric Validation Alert)

Severity Warning

Redfish Event Type

No alerts are applicable for this message

SVAL0002

Message Unable to update the alert subscriber arg1 to database because the ID does not exist.

Arguments arg1 = alert ID

Detailed Description The alert subscriber identified in the message cannot updated because the ID does not exist.

Recommended Response Action Make sure that the subscriber ID exists by querying all alert subscription and retry the operation.

Category Configuration (SVAL = StorageFabric Validation Alert)

Severity Warning

Redfish Event Type

No alerts are applicable for this message

SVAL0003

Message Unable to delete the alert subscriber arg1 to database because the ID does not exist.

Arguments arg1 = alert ID

Detailed Description The alert subscriber identified in the message cannot deleted because the ID does not exist.

Recommended Response Action Make sure that the subscriber ID exists by querying all alert subscription and retry the operation.

Category Configuration (SVAL = StorageFabric Validation Alert)

Severity Warning

Redfish Event Type

No alerts are applicable for this message

SVAL0004

Message	Unable to get the alert subscriber arg1 because the ID does not exist in the database.
Arguments	arg1 = alert ID
Detailed Description	The alert subscriber identified in the message cannot be retrieved because the ID does not exist.
Recommended Response Action	Make sure that the subscriber ID exists by querying all alert subscriptions and retry the operation.
Category	Configuration (SVAL = StorageFabric Validation Alert)
Severity	Warning
Redfish Event Type	

No alerts are applicable for this message

SVAL0005

Message	Unable to add or update alert subscriber because an alert subscriber with a similar content already exists.
Detailed Description	The alert subscriber cannot be added or updated because an alert subscriber with a similar content already exists.
Recommended Response Action	Make sure that the subscription content is different and retry the operation.

StorageFabric Validation License Event Messages

SVLC0001

Message	Unable to download the SmartFabric Storage Software base license because it already exists.
Detailed Description	The base license cannot be downloaded because it already exists. A base license can be downloaded only once.
Recommended Response Action	No action required.
Category	Configuration (SVLC = StorageFabric Validation License)
Severity	Critical
Redfish Event Type	

No alerts are applicable for this message

SVLC0002

Message	Unable to install the SmartFabric Storage Software expansion license because the base license is not installed.
Detailed Description	The Expansion license cannot be installed because the Base lincense is not installed.
Recommended Response Action	Installthevalid Base license and retry the operation. For information aboutBase and Expansion licenses, refer to theSmartFabric Storage Software RESTful API Guide.
Category	Configuration (SVLC = StorageFabric Validation License)
Severity	Warning
Redfish Event Type	

No alerts are applicable for this message

SVLC0003

Message Unable to validate the SmartFabric Storage Software license certificate because the license file is not valid.

Detailed Description The SmartFabric Storage Software license certificate cannot be validated because the license file is invalid.

Recommended Response Action Generate the license certificate by using the Dell Digital license generator and retry the operation.

Category Configuration (SVLC = StorageFabric Validation License)

Severity Warning

Redfish Event Type

No alerts are applicable for this message

SVLC0004

Message Unable to install the license because the device ID associated with the license file does not match the device-id of the SmartFabric Storage Software.

Detailed Description The license file cannot be installed on the SmartFabric Storage Software because the license file generated with the device ID did not match the device ID of the SmartFabric Storage Software on which the license file was installed.

Recommended Response Action Generate a valid license file by using correct SmartFabric Storage Software device ID.

Category Configuration (SVLC = StorageFabric Validation License)

Severity Warning

Redfish Event Type

No alerts are applicable for this message

SVLC0005

Message Unable to install the expansion license because the number of supported licenses (endpoints), which is defined by SmartFabric Storage Software and platform type, has exceeded the maximum value.

Detailed Description The SmartFabric Storage Software expansion license cannot be installed because the number of supported licenses (endpoints), which is defined by SmartFabric Storage Software and platform type, has exceeded the maximum value.

Recommended Response Action Remove the existing expansion license or add the license to another SmartFabric Storage Software, and then retry the operation.

StorageFabric Validation Rest App Event Messages

SVRA0001

Message Unable to retrieve the image details because an invalid Centralized Discovery Controller Image was entered.

Detailed Description The Centralized Discovery Controllerimage entered is invalid.

Recommended Response Action Enter a valid Centralized Discovery Controllerimage and retry the operation.

Category Configuration (SVRA = StorageFabric Validation Rest App)

Severity Critical

Redfish Event Type

No alerts are applicable for this message

SVRA0002

Message Unable to retrieve the SmartFabric Storage Software Application image details because an invalid ID was entered.

Detailed Description The SmartFabric Storage SoftwareApplication image entered is invalid.

Recommended Response Action Enter a valid SmartFabric Storage SoftwareApplication Image and retry the operation.

Category Configuration (SVRA = StorageFabric Validation Rest App)

Severity Critical

Redfish Event Type

No alerts are applicable for this message

SVRA0003

Message Unable to retrieve the image details because an invalid Centralized Discovery Controller Instance ID was entered.

Detailed Description The Centralized Discovery ControllerInstance entered is invalid.

Recommended Response Action Enter a valid Centralized Discovery ControllerInstance and retry the operation.

Category Configuration (SVRA = StorageFabric Validation Rest App)

Severity Critical

Redfish Event Type

No alerts are applicable for this message

SVRA0004

Message Unable to retrieve details because the requested SmartFabric Storage Software Application was not available.

Detailed Description The SmartFabric Storage Software Application entered is invalid.

Recommended Response Action Enter a valid StorageFabric Storage Software Application and retry the operation.

Category Configuration (SVRA = StorageFabric Validation Rest App)

Severity Critical

Redfish Event Type

No alerts are applicable for this message

SVRA0005

Message Unable to retrieve event information because the event ID does not exist in the system.

Detailed Description The event ID cannot be retrieved because the event ID does not exist in the system.

Recommended Response Action Enter a valid event ID and retry the operation.

Category Configuration (SVRA = StorageFabric Validation Rest App)

Severity Warning

Redfish Event Type

No alerts are applicable for this message

SVRA0006

Message Unable to retrieve the Device Details because it is not available in the system.

Detailed Description The device information cannot be retrieved because it does not exist.

Recommended Response Action Retry after sometime. If the issue persist, contact your system administrator.

Category Configuration (SVRA = StorageFabric Validation Rest App)

Severity Warning

Redfish Event Type

No alerts are applicable for this message

SVRA0007

Message Unable to retrieve the SmartFabric Storage Software license ID because it does not exist.

Detailed Description The SmartFabric Storage Software license ID cannot be retrieved because it does not exist.

Recommended Response Action Enter a valid SmartFabric Storage Software license ID, and then retry the operation.

Category Configuration (SVRA = StorageFabric Validation Rest App)

Severity Critical

Redfish Event Type

No alerts are applicable for this message

SVRA0008

Message There is no authentication sequence to retrieve because the authentication sequence is not configured.

Detailed Description The authentication sequence cannot be retrieved because the authentication sequence is not configured.

Recommended Response Action The Local authentication is enabled by default. No action is needed.

Category Configuration (SVRA = StorageFabric Validation Rest App)

Severity Informational

Redfish Event Type

No alerts are applicable for this message

SVRA0009

Message Unable to retrieve the requested remote authentication server instances because the authentication server is not configured.

Detailed Description The requested remote authentication server instances cannot be retrieved because the server is not configured.

Recommended Response Action Enter a valid IP address of the remote authentication server and retry the operation.

Category Configuration (SVRA = StorageFabric Validation Rest App)

Message Unable to launch hardware diagnostics.

Detailed Description Unable to launch hardware diagnostics because the Enterprise UEFI Diagnostics application is corrupt or iDRAC is not responding.

Recommended Response Action Retry the operation. If the problem persists, update the Enterprise UEFI Diagnostics using one of the following methods: 1) Use the Firmware Update feature in Lifecycle Controller. 2) Use the Server Update Utility. 3) Run the Update Package from the operating system. If the problem continues to persist, reset the iDRAC. For more information, contact your service provider.

SWC0727

Message Unable to set the entered attribute because the SNMP user authentication passphrase or SNMP user privacy passphrase is not configured.

Detailed Description: The entered attribute cannot be set because the SNMP user authentication passphrase or SNMP user privacy passphrase is not configured.

Recommended Response Action: Enter the authentication passphrase and privacy passphrase and retry the operation. To set the passphrase values by using the RACADM Command Line Interface (CLI), enter, "racadm set idrac.users.n.SNMPv3AuthenticationPassphrase value" and "racadm set idrac.users.n.SNMPv3PrivacyPassphrase value". Here, value is a string. To set by using the iDRAC GUI, click iDRAC Settings > Users > Local Users > Edit User.

Detailed Description Unable to communicate with the iDRAC of the requested Server.

Check if iDRAC is ready and system is running properly. Utilize the RACADM command by running "racadm getversion" to list all the servers and make sure the iDRAC version is displayed. If the iDRAC is listed as Not Ready then wait until it becomes ready. A Virtual Reseat may be required. The Lifecycle log in the server may have additional information about the inability of the iDRAC to apply Profile settings.

Message The status of Media Access Control (MAC) address arg1 is not valid for Boot Identity profile operations.

Arguments arg1 = mac address

Detailed Description The status of Media Access Control (MAC) address identified in the message is not valid. Possible MAC address status values are unassign, assign and active. The value is "unassigned" if the MAC address is not used in any profile. The value is "assigned" if the MAC address used in a profile. The value is "active" if used in a profile applied to a server. The status must be same for all Virtual MAC addresses if assigned to a profile.

Recommended Response Action: Edit the Virtual MAC Address Pool to correct the MAC address status. Possible MAC address status values are unassign, assign and active. The value is "unassigned" if the MAC address is not used in any profile. The value is "assigned" if the MAC address used in a profile. The value is "active" if used in a profile applied to a server. The status must be same for all Virtual MAC addresses if assigned to a profile.

Message Unable to clear the Boot Identity profile from the server in slot arg1 because there is no response from the server iDRAC.

Arguments arg1 = server slot number

Detailed Description The Boot Identity profile from the server identified in the message cannot be cleared because there is no response from the server iDRAC. A MAC Address conflict is possible if the server retains virtual MAC Address values and they are also allocated to another server.

Recommended Response Action Make sure that the server is not used until the Persistence Policy settings are returned to default values and the Virtual MAC Address settings have been cleared. Persistence Policy settings can be reset to default values by resetting the server iDRAC to factory default settings. If the iDRAC cannot be reset to default values, contact your service provider before attempting to use the server.

Message Unable to configure the storage array in slot arg1 , because there is no communication between Chassis Management Controller (CMC) and the storage device.

Arguments arg1 = slot number

Detailed Description Unable to configure storage array. This could happen if CMC could not communicate with storage device.

Recommended Response Action 1) Reset iDRAC by using the graphical user interface (GUI): Click Chassis Overview > Troubleshooting > Reset Components. In the Reset Server section, from the Reset drop-down menu, select iDRAC Reset corresponding to the server iDRAC to be reset, and then click Apply Selection. Or, reset iDRAC by running the following command at the command line interface (CLI): racadm racreset -m server-n.2. Reset Chassis Management Controller (CMC) by using the GUI: Click Chassis Overview > Troubleshooting > Reset Components, and then click Reset/Failover CMC. Or, reset CMC by running the following command at the CLI: racadm racreset. For more information about the syntax and parameters used, see the iDRAC 8/7 v2.30.30.30 RACADM CLI Guide and the Chassis Management Controller Version 5.0 for Dell PowerEdge M1000e RACADM Command Line Reference Guide available on the support site.

Message Unable to update the firmware version of arg1 arg2 because of the reason indicated in the status code arg3 .

Arguments arg1 = name arg2 = subEntity arg3 = status Code

Detailed Description The firmware version of the sub-entity cannot be updated because of the reason indicated in the status code identified in the message.

Recommended Response Action Make sure that the firmware version and device type are compatible, and then retry the operation. If it does not solve the issue, perform an AC Cycle operation, and then retry. If the issue persists, contact your service provider and provide the status code indicated in the message.

SYS072

Message Server Configuration Profile import operation timed-out.

Detailed Description The import of Server Configuration Profile did not complete as the operation took too long.

Recommended Response Action Review the state of the host server and ensure there is no user input required that has disrupted the SCP workflow. There could be one or more reasons for server to halt at POST.1. The BIOS ErrPrompt setting being Enabled can require manual interaction during POST.2. The iDRAC ServerBoot.1#FirstBootDevice being set to BIOS will boot the system to the BIOS F2 menu requiring manual interaction.3. Review any error listed in POST and take appropriate action mentioned on the screen.If the host booted completed but the operation timed-out, then review the LCL before retrying the operation.

SYS115

Message	The power cord sensor is non-functional.
Detailed Description	The power cord sensor becomes non-functional because of one of the following reasons: 1) The power cable may not be connected properly or disconnected. 2) The power cord sensor in the power supply unit has failed. However, the power supply unit may still function. 3) There is an input power failure.
Recommended Response Action	Do of the following to resolve the issue: 1) Reconnect the power cord to the power supply unit. 2) Replace the power supply unit that has the failed power cord sensor, with a new power supply unit. 3) Make sure that the input power supply is restored.

SYS120

Message Unable to complete the operation because the OS Collector is taking too much time. The operation is cancelled.

Detailed Description The OS Collector application did not complete its task within the maximum allowed time and the operation is cancelled. This may be because the server OS is not supported by the OS Collector application and the application is unable to function correctly.

Recommended Response Action Do the following: 1) Make sure that the OS Collector application supports the OS installed on the server. If the OS is not supported, the OS Collector may not function correctly. 2) Reinstall the latest OS Collector on the iDRAC, and then retry the operation. To install the OS Collector using the iDRAC Web UI, get the latest OC Collector update package and then select the Update and Rollback link from the iDRAC Web UI home page and upload the install package. If the issue persists, contact your service provider.

Message OS Collector: Unable to communicate with WMI services.

Detailed Description The OS Collector application is unable to communicate with the WMI service. This may be because the user context the application is running in does not have appropriate access privileges or firewall/security settings are preventing retrieving registry and software data from WMI.

Recommended Response Action: Do the following: 1) Make sure the user context the OS Collector application is running in has the appropriate privileges to access WMI. Make sure that firewall or security settings are set to allow access and retry the operation. 2) If the issue persists, restart the WMI service and retry the operation. 3) If the issue continues to persist, restart the server OS and retry the operation.

SYS164

Message

Access to Lifecycle Controller internal storage was not acquired.

The System Erase operation attempted to access Lifecycle Controller internal storage that is already being accessed by another function. Exclusive access to the internal storage is required for the System Erase operation. The System Erase operation attempts Lifecycle Controller internal storage access for 10 minutes. After the timeout the current job completes with an unsuccessful status.

Detailed Description

Recommended Response Action

Check the server and make sure that it is not in BIOS POST startup processing or stopped in the POST phase of startup. The server can also be stopped during POST because the is pressed or Option ROM setup utilities are being used. After the BIOS startup has completed, retry the operation.

SYS264

Message: Unable to transfer a file, arg1 , because the proxy server was incapable of performing the file transfer operations.

Arguments: arg1 = filename

Detailed Description: Unable to transfer a file because the proxy server was incapable of performing the file transfer operations even when the network connection is available to the proxy server.

Recommended Response Action: Make sure that correct proxy settings and file transfer parameters are set, and then retry the operation. If the issue persists, try connecting to a different proxy.

SYS268

Message Unable to transfer a file, arg1 , because the proxy operation is taking longer time than the set time limit.

Arguments arg1 = filename

The file cannot be transferred because the proxy operation is taking longer time than the set time limit of the proxy configuration. The other possible reasons are: 1) issue in the network 2) remote host server may not be turned on 1) remote host server is turned on but not functioning 4) an issue in protocol negotiation.

Detailed Description

Recommended Response Action Check the file transfer parameters, health of the remote host, the proxy time limit configuration and then retry the operation.

SYS8500

Message Delay Auto-throttle sent to arg1 server(s). arg2 arg3

Arguments arg1 = number of servers arg2 = error string arg3 = errors

Detailed Description The Chassis Management Controller (CMC) sent messages to delay power throttling to all capable servers in the chassis. This was done because the CMC firmware was updated or a failover was initiated. If specific server errors are shown in the message, verify that the iDRAC and Lifecycle Controller firmware versions on those servers is updated to the most current version available.

Recommended Response Action If no errors are shown, no response is required. If errors are listed in the message, navigate to the named servers and make sure that iDRAC and Lifecycle Controller firmware versions are the latest available.

Thermal Event Messages

THRM0001

Message: The server is currently ignoring the fan speed limit by enabling the Sound Cap thermal profile because of ambient temperature.

Detailed Description: The server is currently ignoring the fan speed limit by enabling the Sound Cap thermal profile because of the ambient temperature.

Recommended Response Action: Make sure that the server is operating within the recommended ambient temperature. After the ambient temperature reduces to the recommended value, the server will revert to the fan speed corresponding to the speed set by the Sound Cap thermal profile.

Category: Configuration (THRM = Thermal)

THRM0003

Message The server is currently ignoring the fan speed limit that is set by enabling the Sound Cap thermal profile because of thermal cooling constraints.

Detailed Description The server is currently ignoring the fan speed limit that is set by enabling the Sound Cap thermal profile because of thermal cooling constraints. The server is expected to reinstate the Sound Cap thermal profile based fan speed limit if the server power consumption and/or power management capabilities allows meeting system thermal requirement. PCIe adapters and storage drives are some sub-systems that do not have granular power controls and may limit overall server power reduction to meet server cooling requirements at the limited fan speed.

Recommended Response Action No response action is required. However, if the situation persists, the system configuration and/or the operating environment is not favorable for this thermal profile. Consider disabling the Sound Cap thermal profile.

THRM0005

Message Sound Cap thermal profile is enabled.

Sound Cap thermal profile is enabled. This thermal profile limits the maximum fan speed (less than permitted full fan speed) to limit the acoustical noise level of the server. The server performance will be compromised to maintain stability with limited cooling available in this mode. The server may automatically ignore the fan speed limit that is set by Sound Cap thermal profile temporarily if the server cooling is at risk. However, some configurations may not be covered by this thermal profile. Make sure to monitor log messages to take appropriate actions where necessary and confirm that the server is not under thermal risk while operating in this mode. PCIe device cooling is an example of the most significant risk when operating in the Sound Cap thermal profile.

TMP0120

Message	The system inlet temperature is greater than the upper warning threshold.
Detailed Description	Ambient air temperature is too warm. The maximum ambient temperature supported varies based on the server configuration. Do the following: See the event log data for information about fan failures. Verify the operating environment of the server by viewing the inlet temperatures of the chassis and sleds in the other slots, and also verify the site conditions to identify significant variations from the chassis temperature. Make sure that the iDRAC and MM firmware versions are up-to-date. Consult EIPT published on www.dell.com/calc for configuration-specific guidance by adding chassis and sleds in the tool to model your situation.

TMP1000

Message arg1 exceeded the maximum warning threshold.

Arguments arg1 = tempsensor name

Detailed Description
The enclosure is too hot. A variety of factors can cause the excessive temperature. For example, a fan may have failed, the thermostat may be set too high, or the room temperature may be too hot.

Recommended Response Action
Check for factors that may cause overheating. For example, verify that the enclosure fan is working. You should check the thermostat settings and examine whether the enclosure is located near a heat source. Make sure the enclosure has enough ventilation and that the room temperature is not too hot. Refer to the enclosure documentation for more diagnostic information.

Message Unable to communicate with iDRAC because of an issue in the iDRAC Keyboard Controller Style (KCS) Intelligent Platform Management Interface (IPMI).

Detailed Description Unable to communicate with iDRAC because of an issue in the iDRAC Keyboard Controller Style (KCS) Intelligent Platform Management Interface (IPMI). Continuing to boot may result in unexpected power loss because of unknown power inventory and unavailability of features such as remote out of band access, active power management, thermal management, inventory collection, LCD, or system error reporting.

Recommended Response Action Do one of the following: 1) Remove input power from the system, wait for 30 seconds, and re-apply input power. Turn on the system. 2) Update the iDRAC firmware on the system.

UEFI0072

Message Unable to load the firmware from arg1 because of the Secure Boot policy.

Arguments arg1 = device name

Detailed Description When the Secure Boot feature is enabled, the system BIOS authenticates each UEFI driver against the Secure Boot policy. If a UEFI driver does not meet the policy criteria, the system BIOS does not load or execute the UEFI driver and displays this message at the end of POST. The Secure Boot policy consists of authorized and unauthorized X.509 certificates; signed drivers must chain to an authorized certificate. The policy may also authorize hash values of individual UEFI driver images. Users can configure the Secure Boot feature and the Secure Boot policy in F2 System Setup > System BIOS > Security Settings page.

Recommended Response Action If the Secure Boot feature is not desired, disable it in System Setup > System BIOS > Security Settings page. Otherwise, do the following: 1) Make sure the firmware on the failing device is up-to-date. 2) If subsequent failures occur, review the Secure Boot Policy Summary in System Setup > System BIOS > Security Settings page. The device firmware must be authorized by a public key or hash value in the Authorized Signature Database. The public key or hash value must not be present in the Forbidden Signature Database.

UEFI0073

Message Unable to boot arg1 because of the Secure Boot policy.

Arguments arg1 = Boot Option name

Detailed Description When the Secure Boot feature is enabled, the system BIOS authenticates each boot option against the Secure Boot policy. If a boot option does not meet the policy criteria, the system BIOS does not boot to the boot option and displays this message. The Secure Boot policy consists of authorized and unauthorized X.509 certificates; signed boot images must chain to an authorized certificate. The policy may also authorize hash values of individual boot images. Users can configure the Secure Boot feature and the Secure Boot policy in System Setup > System BIOS > Security Settings page.

If the Secure Boot feature is not desired, disable it in System Setup > System BIOS > Security Settings page. Otherwise, do the following: 1) review the Secure Boot Policy Summary in F2 System Setup > System BIOS > Security Settings page. The boot option must be authorized by a public key or hash value in the Authorized Signature Database. 2) If the boot option is not authorized but it can be trusted, enter System Setup > System BIOS > Security Settings page, set Secure Boot Policy to Custom, and add a entry for the boot option in the Authorized Signature Database (System Setup > System BIOS > Security Settings > Custom Policy Settings > Authorized Signature Database > Import Database Entry).

Message One or more PCI System errors (SERR) have occurred.

Detailed Description One or more PCI System errors (SERR) have occurred.

Recommended Response Action Check the System Event Log (SEL) to identify the PCI device that caused the SERR. Update the identified device firmware. If the issue persists, contact your service provider.

Message The size and speed of the secondary SD card do not match those of the primary SD card.

Detailed Description The size and speed of the primary SD card do not match those of the secondary SD card. The secondary SD card needs to have equal or greater capacity and speed than the primary SD card.

Recommended Response Action Replace the secondary SD card with one that has equal or greater capacity and speed than the primary SD card.

Message	Unable to configure memory interleaving on DIMM modules on memory slots: arg1 .
Arguments	arg1 = slot numbers
Detailed Description	Memory could not be interleaved because a negative Target Address Decode (TAD) offset was calculated during memory initialization.
Recommended Response Action	Check the DIMM population and hardware configuration to make sure interleaving can be supported. For more information, see the platform Owners Manual.

Message	Unable to configure memory interleaving on DIMM modules on memory slots: arg1 .
Arguments	arg1 = slot numbers
Detailed Description	Memory could not be interleaved because low memory (i.e. memory below the 4GB boundary) cannot be split evenly across processor sockets during memory initialization.
Recommended Response Action	Check the DIMM population and hardware configuration to make sure interleaving can be supported. For more information, see the platform Owners Manual.

Message	Unable to configure memory interleaving on DIMM modules on memory slots: arg1 .
Arguments	arg1 = slot numbers
Detailed Description	Memory could not be interleaved because of an attempt to simultaneously configure incompatible A7 mode and Target Address Decode (TAD) 3-way interleave during memory initialization.
Recommended Response Action	Check the DIMM population and hardware configuration to make sure interleaving can be supported. For more information, see the platform Owners Manual.

Arguments arg1 = slot numbers

Detailed Description An error occurred during DDR memory initialization during the Command Clock Training - Group 1 phase.

Recommended Response Action Do the following: 1) Remove input power to the system, 2) Reseat the DIMM module and 3) Restart the system. If the issue persists, then replace the faulty memory module(s) identified in the message.

Message: Memory riser arg1 is populated behind an empty processor socket.

Arguments: arg1 = riser number

Detailed Description A memory riser was detected behind an empty processor socket. Memory must be installed behind a populated processor socket in order to be recognized by the system and available for usage. Check to make sure processors and memory are installed in a supported configuration.

Recommended Response Action Do the following: 1) Remove input power to the system, 2) Populate processors and memory in a supported configuration and 3) Restart the system. For more information, see the platform Owners Manual.

Message Unable to boot a boot option because the watchdog timer has expired. System will reset.

Detailed Description The watchdog timer is armed before the BIOS boot manager invokes a UEFI boot option. The watchdog is set to a period of 5 minutes. The Operating System boot loader from the boot option is required to disable the watchdog timer after it is successfully loaded, otherwise the system will reset if the timer expires.

Recommended Response Action Check the boot option image and boot loader. Update them to the latest version if possible.

Message Unable to write the command to Mailbox Interface CSR register during Memory Reference Code (MRC) initialization because the Power Control Unit (PCU) Mailbox is not responding.

Detailed Description The command cannot be written to Mailbox Interface CSR register during Memory Reference Code (MRC) initialization because the Power Control Unit (PCU) Mailbox is not responding.

Recommended Response Action Do the following: 1) Disconnect the input power supply to the server. 2) Reseat all processors. 3) Restart the server. If the issue persists, contact your service provider.

UEFI0284

Message Unable to import Secure Boot policy data because the format of the data is incompatible with the Secure Boot databases.

The BIOS cannot accept the Secure Boot policy data from the management console because the format of the data is incompatible with the BIOS Secure Boot databases. Secure Boot policy data consists of a Platform Key (PK), Key Exchange Key (KEK) database, Authorized Signature Database (db), and Forbidden Signature Database (dbx). The contents of PK and KEK must follow the Distinguished Encoding Rules (DER) X.509 certificate format. Each entry in db and dbx must follow the DER X.509 certificate format or consist of a hash value generated by a Secure Hash Algorithm (SHA-256, SHA-384, or SHA-512).

Make sure certificates follow the Distinguished Encoding Rules (DER) X.509 certificate format. Hash values in the Secure Boot policy must be 32 bytes, 48 bytes, or 64 bytes in size. Also make sure the data for the Platform Key (PK) and Key Exchange Key (KEK) database contain only certificates, not hash values. If the import operation includes multiple policy objects (certificates or hash values), determine the failing object by retrying the operation with one object at a time.

UEFI0285

Unable to send Secure Boot policy data to iDRAC because of an issue in the iDRAC Shared Memory Architecture (SMA) Intelligent Platform Management Interface (IPMI).

The BIOS cannot send Secure Boot policy data (certificates and hash values) to iDRAC because of an issue in the iDRAC Shared Memory Architecture (SMA) Intelligent Platform Management Interface (IPMI). This means management consoles will not display the latest Secure Boot policy data because BIOS is not synchronized with iDRAC. Synchronization must occur before using management consoles to configure Secure Boot policy data.

Message One or more memory errors have occurred during the Double Data Rate (DDR) memory channel initialization on the memory slot arg1 .

Arguments arg1 = slot number

Detailed Description One or more memory errors have occurred during the Double Data Rate (DDR) memory channel initialization on the memory slot identified in the message. This can be because of control clock lookback training error.

Recommended Response Action Disconnect the input power to the system, reseal the DIMM, reconnect the power, and then restart. If the issue persists, replace the faulty DIMM installed in the slot identified in the message.

UEFI0399

Message Unable to complete the Transport Layer Security (TLS) or Secure Socket Layer (SSL) handshake operation. The issue information code: arg1 , arg2 , Library arg3 , Function arg4 , and Issue cause arg5 .

Arguments arg1 = Error Details State arg2 = Issue Code arg3 = Library Name arg4 = Function Name arg5 = Issue Reason

Detailed Description Unable to complete the Transport Layer Security (TLS) or Secure Socket Layer (SSL) handshake operation. Issue related information is as identified in the message. TLS (Transport Layer Security, whose predecessor is SSL) is the standard security technology for establishing an encrypted link between a web server and a web client, such as a browser or an app. A handshake is a process that enables the TLS/SSL client and server to establish a set of secret keys with which they can communicate. During this process, the client and server: 1. Agree on the version of the protocol to use. 2. Select the cryptographic algorithm to be used. 3. Authenticate each other by exchanging and validating digital certificates. If the TLS/SSL handshake succeeds then the TLS/SSL client and server securely transfers data to each other. Else, if a TLS/SSL handshake failure occurs then the connection is ended.

Recommended Response Action Do the following and retry the operation: 1) Read through the information provided in the message and initiate necessary action. 2) Make sure that the protocol used by the client is supported by the server. 3) Make sure that the client configuration matches the customer configuration saved on the server.

Message The NVDIMMs on socket arg1 are installed in an unsupported (configuration) manner.

Arguments arg1 = number

Detailed Description The NVDIMMs on socket identified in the message are installed in an unsupported (configuration) manner. The Memory initialization Reference Code (MRC) feature verifies the DIMM population that does not meet the POR(Plan Of Record) requirements.

Recommended Response Action: Make sure that the DIMMs are populated as recommended, and then retry the operation. For information about correct population of DIMMs, see the server-specific installation and Service Manual available on the support site.

Message: Unable to recognize the Chassis type because the Chassis Manager firmware may not be up-to-date, and it must be at version arg1 or later.

Arguments: arg1 = versionNum

Detailed Description: The Chassis type cannot be recognized because the Chassis Manager firmware may not be up-to-date, and it must be at version 3.x or later as identified in the message.

Recommended Response Action: 1) Visit Dell Technologies support site. 2. Search for the chassis model name (for example, C6400). 3. Click DRIVERS & DOWNLOADS. 4. From the Category drop-down menu, select Chassis System Management. 5. From the list of firmware displayed, select the check box corresponding to the latest version, and then click Download.

UEFI0416

Message Unable to fully enumerate the Data Processing Unit (DPU) arg1 installed on the server because this DPU was not ready within the specified timeout period.

Arguments arg1 = DPU FQDD

Detailed Description The Data Processing Unit (DPU) identified in the message installed on the server cannot be fully enumerated because this DPU is not ready within the specified timeout period. If the Operating System (OS) of Data Processing Unit is not booted before the system BIOS PCIe enumeration, the system BIOS will not initialize the additional PCIe functions that would be enabled by the OS of Data Processing Unit.

Recommended Response Action Update the Operating System and firmware of the Data Processing Unit (DPU), and then restart the server. If the issue persists, contact your service provider. For information about updating DPU operating system, see the User Documentation supplied with the DPU or available on the support site.

UEFI0417

Message When TLS is enabled, insecure HTTP boot without TLS is not allowed.

Detailed Description System BIOS is unable to boot via HTTP protocol (HTTP without TLS) because TLS mode is currently enabled.

It is recommended to use HTTP boot over TLS for better security. To enable HTTP over TLS, 1) Set TLS Authentication Mode from None to desired mode in Network Settings > HTTP Device Settings > TLS Authentication Configuration 2) Import appropriate certificate in Root Certificate Configuration under same page. 3) HTTP boot URI should start with https:// and configure necessary network environment.

Recommended Response Action Alternatively, change TLS Authentication Mode to None to disable TLS. However, please note that HTTP without TLS is not secure.

Virtual Disk Event Messages

VDR1

Message arg1 failed.

Arguments arg1 = VD Name

Detailed Description: A storage component such as a physical disk or an enclosure has failed. The failed component may have been identified by the controller while performing a task such as a rescan or a check consistency.

Recommended Response Action: Replace the failed component. You can identify which component has failed by locating the component that has a red "X" for its status. Perform a rescan after replacing the failed component.

Message	Corrected disk storage medium error on arg1 .
Arguments	arg1 = virtual disk name
Detailed Description	The controller corrected a disk storage medium error on one of the participating physical disks of the virtual disk identified in the message.
Recommended Response Action	No response action is required.
Category	Storage (VDR = Virtual Disk)
Severity	Informational
OMSA Event ID	2418
OMSA Trap ID	120100
Redfish Event Type	
	No alerts are applicable for this message

VDR112

Message	Deleted the arg1 .
Arguments	arg1 = virtual disk

Detailed Description: The controller removed a virtual disk because of a delete virtual disk operation or a reset configuration operation.

Recommended Response Action: No response action is required.

Category: Storage (VDR = Virtual Disk)

Severity: Warning

Redfish Event Type: No alerts are applicable for this message

VDR113

Message: Controller preserved cache was discarded by user for arg1 .

Arguments: arg1 = virtual disk

Detailed Description: This message occurs if the controller pinned cache is discarded for a virtual disk by user.

Recommended Response Action: No response action is required.

Category: Storage (VDR = Virtual Disk)

Severity: Informational

LCD Message: Cache discarded for a virtual disk

Message The check consistency has made corrections and completed for arg1 .
 Arguments arg1 = VD name
 Detailed Description The virtual disk check consistency has identified issues and made corrections. For example, the check consistency may have encountered a bad disk block and remapped the disk block to restore data consistency. This alert is provided for informational purposes.
 Recommended Response
 Action No response action is required. As a precaution, monitor the Log for other errors related to this virtual disk. If problems persist, contact technical support.

VDR49

Message arg1 is permanently degraded.

Arguments arg1 = VD Name

Detailed Description: A redundant virtual disk has lost redundancy. This may occur when the virtual disk suffers the failure of more than one physical disk. In this case, both the source physical disk and the target disk with redundant data have failed. A rebuild is not possible because there is no longer redundancy.

Recommended Response Action: Replace the failed disks and restore from backup.

VDR50

Message Background Initialization (BGI) completed with uncorrectable errors on arg1 .

Arguments arg1 = virtual disk

Detailed Description The background initialization task encountered errors that cannot be corrected. The virtual disk contains physical disks that have unusable disk space or disk errors that cannot be corrected.

Recommended Response Action Review other messages to identify whether the physical disk that has errors. If the virtual disk is redundant, you can replace the physical disk and continue using the virtual disk. If the virtual disk is non-redundant, you need to recreate the virtual disk after replacing the physical disk. After replacing the physical disk, run a consistency check to verify the data.

VDR52

Message The consistency check found inconsistent parity data on arg1 .
 Arguments arg1 = virtual disk
 Detailed Description The data on physical disk members of the virtual disk does not match. Redundancy may be lost.
 Recommended Response Rerun the consistency check task. If you receive this message again, verify the health of the physical disks included in the virtual disk. See the storage hardware documentation for more information. Review messages for significant messages related to the physical disks. If a physical disk has a problem, replace it and restore from a backup copy.
 Action Contact technical support if the issue persists.

VDR56

Message	Redundancy of arg1 has degraded.
Arguments	arg1 = virtual disk
Detailed Description	This message occurs when a physical disk in the disk group was removed or when a physical disk included in a redundant virtual disk fails. Because the virtual disk is redundant (uses mirrored or parity information) and only one physical disk has failed, the virtual disk can be rebuilt. Typically, the virtual disk (E.g. RAID 6) has multiple redundant disks and there is a problem with one of them.
Recommended Response Action	Replace the missing or failed physical disk.

VDR57

Message Background Initialization in arg1 corrected medium error.
 Arguments arg1 = VD Name
 Detailed Description A disk media error was detected while the controller was completing a background task. A bad disk block was identified. The disk block has been remapped.
 Recommended Response Action Consider replacing the disk. If you receive this alert frequently, ensure to replace the disk. It is recommended to routinely back up your data.

VDR58

Message Bad block medium error is detected at block arg1 on arg2 .
 Arguments arg1 = args arg2 = VD Name
 Detailed Description Virtual disk bad blocks are due to presence of unrecoverable bad blocks on one or more member physical disks. Loss of data and/or redundancy may have occurred.

Recommended Response Action Do the following and retry the operation: 1) Replace the RAID controller battery. For information about replacing the battery, see the hardware documentation of the respective RAID card. 2) If the issue persists, contact the Technical Support team.

VDR7

Message	arg1 has failed.
Arguments	arg1 = virtual disk
Detailed Description	One or more physical disks included in the virtual disk have failed. If the virtual disk is non-redundant (does not use mirrored or parity data), then the failure of a single physical disk can cause the virtual disk to fail. If the virtual disk is redundant, then more physical disks have failed than you can rebuild using mirrored or parity information.
Recommended Response Action	Contact the Dell Technical Support for assistance about troubleshooting and resolution.

VDR8

Message	arg1 is degraded either because the physical disk drive in the drive group is removed or the physical disk drive added in a redundant virtual drive has failed.
Arguments	arg1 = virtual disk
Detailed Description	The virtual drive on the Controller identified in the message is degraded either because the physical disk drive in the drive group is removed or the physical disk drive added in a redundant virtual drive has failed.
Recommended Response Action	Do the following and retry the operation: 1) Insert a physical disk drive. After the drive is inserted, the previous data is automatically rebuilt by the system. 2) If not already done, configure a hot-spare for the virtual drive. 3) If a physical disk drive is removed from the disk drive group, either replace the disk or restore the original disk drive.

VDR98

Message	arg1 has switched active controllers. Its active path is now through arg2 .
Arguments	arg1 = virtual disk arg2 = controller name
Detailed Description	The virtual disk identified in the message has changed active paths. This can be because of an attempt to optimize the throughput of the system or it could be because of a controller failover.
Recommended Response	
Action	No response action is required.
Category	Storage (VDR = Virtual Disk)

VDR99

Message arg1 is unavailable because of an ID conflict in the fault-tolerant pair.
 Arguments arg1 = virtual disk
 Detailed Description The virtual disk identified in the message cannot be used because of an ID conflict with another virtual disk.
 Recommended Response Power cycle the system chassis to restore the virtual disk. If this does not correct the problem then contact your service provider.

Voltage Event Messages

VLT0100

Message Processor module arg1 voltage is less than the lower warning threshold.

Arguments arg1 = name

Detailed Description System hardware detected an over voltage or under voltage condition. If multiple voltage exceptions occur consecutively the system may power down in failsafe mode.

Recommended Response Action 1) Review system logs for power supply exceptions.2) Remove the processor module. Inspect processor socket for bent pins. 3) If the problem persists, contact technical support. Refer to the product documentation to choose a convenient contact method.

VLT0225

Message The memory module arg1 voltage is less than the lower critical threshold.

Arguments arg1 = name

Detailed Description System hardware detected an over voltage or under voltage condition. If multiple voltage exceptions occur consecutively the system may power down in failsafe mode.

Recommended Response Action 1) Review system logs for power supply exceptions. 2) Reseat the memory module. 3) If the problem persists, contact technical support. Refer to the product documentation to choose a convenient contact method.

VLT0300

Message CPU arg1 arg2 voltage is less than the lower warning threshold.

Arguments arg1 = number arg2 = name

Detailed Description Low voltages may be the result of a problem with the voltage regulator or a problem with the processor. The low voltage may cause the processor to fail to operate.

Recommended Response Action 1) Turn system off and remove input power for one minute. Re-apply input power and turn system on. 2) Make sure the processor is seated correctly. 3) If the issue still persists, contact technical support. Refer to the product documentation to choose a convenient contact method.

VLT400

Message The arg1 sensor has failed with a value arg2 Volts.

Arguments arg1 = sensor name arg2 = voltage

Detailed Description A voltage sensor identified in the message may have failed. This condition can cause system performance issues and degradation in the monitoring capability of the system.

Recommended Response Action Do one of the following to resolve the issue: 1) Verify the Embedded System Management (ESM) Log for any sensor related faults. If there is a failed sensor, replace the system board. 2) Re-configure the system to a minimum configuration, and verify if the sensor displays a normal value, otherwise replace the system board. 3) If the sensor identified is a processor voltage sensor, remove the processor module and inspect processor socket, and replace if required. If the issue persists, contact your service provider.

Message The Witness Server CPU is throttled.

Detailed Description The Witness Server processor temperature increased beyond the threshold value. The Processor thermal protection triggered the CPU throttle action. Factors external to the processor may have induced this issue.

Recommended Response Action Do the following: 1) Review the LC or SEL log data to check if there is any fan failure. If yes, replace the fan. 2) Else, check the inlet temperature by running RACADM GetSensorInfo command or iDRAC GUI Temperature page.
